## Not Recommended for New Designs

Please use RE46C191

# **RE46C190**

# CMOS Low Voltage Photoelectric Smoke Detector ASIC with Interconnect and Timer Mode

#### Features

- Two AA Battery Operation
- Internal Power-on Reset
- Low Quiescent Current Consumption
- Available in 16L N SOIC
- · Local Alarm Memory
- Interconnect up to 40 Detectors
- 9-Minute Timer for Sensitivity Control
- Temporal or Continuous Horn Pattern
- Internal Low Battery and Chamber Test
- · All Internal Oscillator
- · Internal Infrared Emitter Diode (IRED) Driver
- · Adjustable IRED Drive Current
- Adjustable Hush Sensitivity
- · 2% Low Battery Set Point

| Note: | The RE46C191 is an improved version of |

|       | RE46C191.                              |

#### Description

The RE46C190 is a low-power, low-voltage CMOS photoelectric-type smoke detector IC. With minimal external components, this circuit will provide all the required features for a photoelectric-type smoke detector.

The design incorporates a gain-selectable photo amplifier for use with an infrared emitter/detector pair.

An internal oscillator strobes power to the smoke detection circuitry every 10 seconds, to keep the standby current to a minimum. If smoke is sensed, the detection rate is increased to verify an Alarm condition. A high gain mode is available for push-button chamber testing.

A check for a low battery condition is performed every 86 seconds and chamber integrity is tested once every 43 seconds when in Standby. The temporal horn pattern supports the NFPA 72 emergency evacuation signal.

An interconnect pin allows multiple detectors to be connected such that, when one unit alarms, all units will sound.

An internal nine-minute timer can be used for a Reduced Sensitivity mode.

Utilizing low-power CMOS technology, the RE46C190 was designed for use in smoke detectors that comply with Underwriters Laboratory Specification UL217 and UL268.

#### **PIN CONFIGURATION**

#### TYPICAL BLOCK DIAGRAM

#### **TYPICAL BATTERY APPLICATION**

5: Inductor L1 must have a maximum peak current rating of at least 1.5A.

NOTES:

#### 1.0 ELECTRICAL CHARACTERISTICS

#### Absolute Maximum Ratings†

| Supply VoltageV <sub>DD</sub> = 5.5V; $V_{BST}$ = 13V                             |
|---|
| Input Voltage Range Except FEED, TEST V <sub>IN</sub> =3V to V <sub>DD</sub> +.3V |
| FEED Input Voltage Range $V_{INFD}$ =- 10 to +22V                                 |
| TEST Input Voltage Range V <sub>INTEST</sub> =3V to V <sub>BST</sub> +.3V         |
| Input Current except FEEDI <sub>IN</sub> = 10 mA                                  |
| Continuous Operating Current (HS, HB, V_{BST}) I_O= 40 mA                         |
| Continuous Operating Current (IRED)I <sub>OIR</sub> = 300 mA                      |
| Operating Temperature $T_A = -10$ to +60°C  |
| Storage TemperatureT <sub>STG</sub> = –55 to +125°C                               |
| ESD Human Body Model V <sub>HBM</sub> = 750V                                      |
| ESD Machine Model   |

**† Notice:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

#### DC ELECTRICAL CHARACTERISTICS

**DC Electrical Characteristics:** Unless otherwise indicated, all parameters apply at  $T_A = -10$  to +60°C,  $V_{DD} = 3V$ ,  $V_{BST} = 4.2V$ , Typical Application (unless otherwise noted) (Note 1, Note 2, Note 3)

#### 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

| TADLE Z-T.       |                  |  |
|------------------|------------------|--|
| RE46C190<br>SOIC | Symbol           | Function   |
| 1                | V <sub>SS</sub>  | Connects to the negative supply voltage.   |
| 2                | IRED             | Provides a regulated and programmable pulsed current for the infrared emitter diode.   |
| 3                | V <sub>DD</sub>  | Connects to the positive supply or battery voltage.  |
| 4                | TEST             | This input is used to invoke Test modes and the Timer mode. This input has an internal pull-down.  |
| 5                | TEST2            | Tests input for test and programming modes. This input has an internal pull-down.  |
| 6                | IRP              | Connects to the anode of the photo diode.  |
| 7                | IRN              | Connects to the cathode of the photo diode.  |
| 8                | RLED             | Open drain NMOS output, used to drive a visible LED. This pin provides load current for the low battery test and is a visual indicator for Alarm and Hush modes.         |
| 9                | GLED             | Open drain NMOS output used to drive a visible LED to provide visual indication of an Alarm Memory condition.  |
| 10               | FEED             | Usually connected to the feedback electrode through a current limiting resistor. If not used, this pin must be connected to $V_{DD}$ or $V_{SS}.$                        |
| 11               | IRCAP            | Used to charge and monitor the IRED capacitor.   |
| 12               | IO               | This bidirectional pin provides the capability to interconnect many detectors in a single system. This pin has an internal pull-down device and a charge dump device.    |
| 13               | HB               | This pin is connected to the metal electrode of a piezoelectric transducer.  |
| 14               | HS               | This pin is a complementary output to HB, connected to the ceramic electrode of the piezoelectric transducer.  |
| 15               | V <sub>BST</sub> | Boosted voltage produced by DC-DC converter.   |
| 16               | LX               | Open drain NMOS output, used to drive the boost converter inductor. The inductor should be connected from this pin to the positive supply through a low resistance path. |

#### TABLE 2-1: PIN FUNCTION TABLE

I

I.

NOTES:

#### 3.0 DEVICE DESCRIPTION

#### 3.1 Standby Internal Timing

The internal oscillator is trimmed to  $\pm 6\%$  tolerance. Once every 10 seconds, the boost converter is powered up, the IRcap is charged from V<sub>BST</sub> and then the detection circuitry is active for 10 ms. Prior to completion of the 10 mS period, the IRED pulse is active for a user-programmable duration of 100 to 400 µs. During this IRED pulse, the photo diode current is integrated and then digitized. The result is compared to a limit value stored in EEPROM during calibration to determine the photo chamber status. If a smoke condition is present, the period to the next detection decreases and additional checks are made.

#### 3.2 Smoke Detection Circuitry

The digitized photo amplifier integrator output is compared to the stored limit value at the conclusion of the IRED pulse period. The IRED drive is all internal, and both the period and current are user programmable. Three consecutive smoke detections will cause the device to go into Alarm and activate the horn and interconnect circuits. In Alarm, the horn is driven at the high-boost voltage level, which is regulated based on an internal voltage reference and therefore results in consistent audibility over battery life. RLED will turn on for 10 ms at a 2 Hz rate. In Local Alarm, the integration limit is internally decreased to provide alarm hysteresis. The integrator has three separate gain settings:

L

- · Normal and Hysteresis
- Reduced Sensitivity (HUSH)
- · High Gain for Chamber Test and Push-to-Test

There are four separate sets of integration limits (all user programmable):

- Normal Detection
- Hysteresis
- HUSH

г

Chamber Test and Push-to-Test modes

In addition, there are user selectable integrator gain settings to optimize detection levels (see Table 4-1).

#### 3.3 Supervisory Tests

Once every 86 seconds, the status of the battery voltage is checked by enabling the boost converter for 10 ms and comparing a fraction of the  $V_{DD}$  voltage to an internal reference. In each period of 344 seconds, the battery voltage is checked four times. Three checks are unloaded and one check is performed with the RLED enabled, which provides a battery load. The High Boost mode is active only for the loaded low battery test. In addition, once every 43 seconds the chamber is activated and a High Gain mode and chamber test limits are internally selected. A check of the chamber is made by amplifying background reflections. The Low Boost mode is used for the chamber test.

If either the low battery test or the chamber test fails, the horn will pulse on for 10 ms every 43 seconds, and will continue to pulse until the failing condition passes. If two consecutive chamber tests fail, the horn will pulse on three times for 10 ms, separated by 330 ms every 43 seconds. Each of the two supervisory test audible indicators is separated by approximately 20 seconds.

As an option, a Low Battery Silence mode can be invoked. If a low battery condition exists and the TEST input is driven high, the RLED will turn on. If the TEST input is held for more than 0.5 second, the unit will enter the Push-to-test operation described in Section 3.4 "Push-to-Test Operation (PTT)". After the TEST input is driven low, the unit enters in Low Battery Hush mode and the 10 ms horn pulse is silenced for 8 hours. The activation of the test button will also initiate the 9 minute Reduced Sensitivity mode described in Section 3.6 "Reduced Sensitivity Mode". At the end of the 8 hours, the audible indication will resume if the low battery condition still exists.

#### 3.4 Push-to-Test Operation (PTT)

If the TEST input pin is activated ( $V_{IH}$ ), the smoke detection rate increases to once every 250 ms after one internal clock cycle. In Push-to-Test, the photo amplifier High Gain mode is selected and background reflections are used to simulate a smoke condition. After the required three consecutive detections, the device will go into a Local Alarm condition. When the TEST input is driven low ( $V_{IL}$ ), the photo amplifier Normal Gain is selected, after one clock cycle. The detection rate continues at once every 250 ms until three consecutive No Smoke conditions are detected. At this point, the device returns to standby timing. In addition, after the TEST input goes low, the device enters the HUSH mode (see Section 3.6 "Reduced Sensitivity Mode").

#### 3.5 Interconnect Operation

The bidirectional IO pin allows the interconnection of multiple detectors. In a Local Alarm condition, this pin is driven high (High Boost) immediately through a constant current source. Shorting this output to ground will not cause excessive current. The IO is ignored as input during a Local Alarm.

The IO pin also has an NMOS discharge device that is active for 1.3 seconds after the conclusion of any type of Local Alarm. This device helps to quickly discharge any capacitance associated with the interconnect line.

If a remote, active high signal is detected, the device goes into Remote Alarm and the horn will be active. RLED will be off, indicating a Remote Alarm condition. Internal protection circuitry allows the signaling unit to have a higher supply voltage than the signaled unit, without excessive current draw.

The interconnect input has a 336 ms nominal digital filter. This allows the interconnection to other types of alarms (carbon monoxide, for example) that may have a pulsed interconnect signal.

#### 3.6 Reduced Sensitivity Mode

A Reduced Sensitivity or Hush mode is initiated by activating the TEST input ( $V_{IH}$ ). If the TEST input is activated during a Local Alarm, the unit is immediately reset out of the alarm condition and the horn is silenced. When the TEST input is deactivated ( $V_{IL}$ ), the device enters into a 9-minute nominal Hush mode. During this period, the HUSH integration limit is selected. The hush gain is user programmable. In Reduced Sensitivity mode, the RLED flashes for 10 ms every 10 seconds to indicate that the mode is active.

As an option, the Hush mode will be canceled if any of the following conditions exist:

- Reduced sensitivity threshold is exceeded (high smoke level)
- An interconnect alarm occurs
- TEST input is activated again

#### 3.7 Local Alarm Memory

An Alarm Memory feature allows easy identification of any unit that had previously been in a Local Alarm condition. If a detector has entered a Local Alarm, when it exits that Local Alarm, the Alarm Memory latch is set. Initially the GLED can be used to visually identify any unit that had previously been in a Local Alarm condition. The GLED flashes three times spaced 1.3 seconds apart. This pattern will repeat every 43 seconds. The duration of the flash is 10 ms. In order to preserve battery power, this visual indication will stop after a period of 24 hours. The user will still be able to identify a unit with an active alarm memory by pressing the Push-to-Test button. When this button is active, the horn will chirp for 10 ms every 250 ms.

If the Alarm Memory condition is set, then any time the Push-to-Test button is pressed and released, the Alarm Memory latch is reset.

The initial 24-hour visual indication is not displayed if a low battery condition exists.

#### 3.8 End of Life Indicator

As an option, after every 14 days of continuous operation, the device will read a stored age count from the EEPROM and increment this count. After 10 years of powered operation, an audible warning will occur indicating that the unit should be replaced. This indicator will be similar to the chamber test failure warning in that the horn will pulse on three times for 10 ms separated by 330 ms every 43 seconds. This indicator will be separated from the low battery indicator by approximately 20 seconds.

#### 4.0 USER PROGRAMMING MODES

#### TABLE 4-1: PARAMETRIC PROGRAMMING

| Parametric Pr         | ogramming  | Ra     | inge            | Resolution           |        |  |

|                       | GF = 2     | 29     | 14.5            | 9.6                  | 7.2    |  |
|                       | GF = 3     | 14.5   | 7.2             | 4.8                  | 3.6    |  |
|                       | GF = 4     | 7.2    | 3.6             | 2.4                  | 1.8    |  |
| Hush                  | GF = 1     | 116    | 58              | 38.8                 | 29     |  |
|                       | GF = 2     | 58     | 29              | 19.4                 | 14.5   |  |
|                       | GF = 3     | 29     | 14.5            | 9.6                  | 7.2    |  |
|                       | GF = 4     | 14.5   | 7.2             | 4.8                  | 3.6    |  |
| Chamber Test          | GF = 1     | 29     | 14.5            | 9.6                  | 7.2    |  |
| -                     | GF = 2     | 14.5   | 7.2             | 4.8                  | 3.6    |  |
|                       | GF = 3     | 7.2    | 3.6             | 2.4                  | 1.8    |  |
|                       | GF = 4     | 3.6    | 1.8             | 1.2                  | 0.9    |  |

Note 1: GF is the user selectable Photo Integration Gain Factor. Once selected, it applies to all modes of operation. For example, if GF = 1 and integration time is selected to be 100 μs, the ranges will be as follows: Normal/Hysteresis = 58 nA, Hush = 116 nA, Chamber Test = 29 nA.

**2:** Nominal measurement resolution in each case will be 1/31 of the maximum input range.

3: The same current resolution and ranges applies to the limits.

#### TABLE 4-2: FEATURES PROGRAMMING

| Features                                 | Options  |  |  |
|--|--|--|--|
| Tone Select                              | Continuous or NFPA Tone  |  |  |
| 10-Year End-of-life Indicator            | Enable/Disable   |  |  |
| Photo Chamber Long-Term Drift Adjustment | Disable.<br>The RE46C190 is not recommended for LTD applications.<br>The RE46C191 should be used for LTD applications.   |  |  |
| Low Battery Hush                         | Enable/Disable   |  |  |
| Hush Options                             | Option 1: Hush mode is not canceled for any reason. If the test button is pushed during Hush, the unit reverts to Norma Sensitivity to test the unit, but when it comes out of test, resumes in Hush where it left off.  |  |  |
|  | Option 2: The Hush mode is canceled if the Reduced<br>Sensitivity threshold is exceeded (high smoke level), and if<br>an external (interconnect alarm) is signaled. If the test button<br>is pushed during Hush, after the test is executed, the Hush<br>mode is terminated. |  |  |

#### 4.1 Calibration and Programming Procedures

Eleven separate programming and test modes are available for user customization. To enter these modes, after power-up, TEST2 must be driven to  $V_{DD}$  and held at that level. The TEST input is then clocked to step through the modes. FEED and IO are reconfigured to become test mode inputs, while RLED, GLED and HB become test mode outputs. The test mode functions for each pin are outlined in Table 4-3.

When TEST2 is held at  $V_{DD}$ , TEST becomes a tri-state input with nominal input levels at  $V_{SS}$ ,  $V_{DD}$  and  $V_{BST}$ . A TEST clock occurs whenever the TEST input switches from  $V_{SS}$  to  $V_{BST}$ . The TEST Data column represents the state of TEST when used as a data input, which would be either  $V_{SS}$  or  $V_{DD}$ . The TEST pin can therefore be used as both a clock, to change modes, and a data input, once a mode is set. Other pin functions are described in Section 4.2 "User Selections".

| Mode | Description   | TEST<br>Clock    | TEST<br>Data    | TEST2           | FEED             | ю                        | RLED | GLED     | НВ                      |
|------|---|------------------|-----------------|-----------------|------------------|--------------------------|------|----------|-------------------------|

| T11  | Horn Test   | 11               | not used        | $V_{DD}$        | FEED             | HornEn                   | RLED | GLED     | HB                      |

1

Note 1: SmkComp (HB) – digital comparator output (high if Gamp < IntegOut; low if Gamp > IntegOut).

2: SCMP (HB) – digital output representing comparison of measurement value and associated limit. Signal is valid only after MeasEn has been asserted and measurement has been made. (SCMP high if measured value > limit; low if measured value < limit).</p>

3: LatchLim (IO) – digital input used to latch present state of limits (Gamp level) for later storage. T1-T4 limits are latched, but not stored until ProgEn is asserted in T5 mode.

4: Operating the circuit in this manner with nearly continuous IRED current for an extended period of time may result in undesired or excessive heating of the part. The duration of this step should be minimized.

5: The RE46C190 is not recommended for LTD applications. The RE46C191 should be used for LTD applications.

#### 4.2 User Selections

Prior to smoke calibration, the user must program the functional options and parametric selections. This requires that 14 bits, representing selected values, be clocked in serially using TEST as a data input and FEED as a clock input and then be stored in the internal EEPROM.

The detailed steps are as follows:

 Power up with bias conditions as shown in Figure 4-1. At power-up TEST = TEST2 = FEED = IO = V<sub>SS</sub>.

L

# RE46C190

- 2. Drive TEST2 input from  $V_{SS}$  to  $V_{DD}$  and hold at  $V_{DD}$  through Step 5 below.
- 3. Using TEST as data and FEED as clock, shift in values as selected from Register 4-1.

Note: For test mode T0 only 14 bits (bits 25-38) will be loaded. For test mode T6 all 39 bits (bits 0-38), will be loaded.

#### 4.3 Smoke Calibration

A separate calibration mode is entered for each measurement mode (Normal, Hysteresis, Hush and Chamber Test) so that independent limits can be set for each. In all calibration modes, the integrator output can be accessed at the GLED output.

The Gamp output voltage, which represents the smoke detection level, can be accessed at the RLED output. The SmkComp output voltage is the result of the comparison of Gamp with the integrator output and can be accessed at HB. The FEED input can be clocked to step up the smoke detection level at RLED. Once the desired smoke threshold is reached, the TEST input is pulsed low to high to store the result.

The procedure is described in the following steps:

- 1. Power-up with the bias conditions shown in Figure 4-1.
- 2. Drive TEST2 input from  $V_{SS}$  to  $V_{DD}$  to enter the Programming mode. TEST2 should remain at  $V_{DD}$  through Step 7.
- 3. Apply a clock pulse to the TEST input to enter in T1 mode. This initiates the calibration mode for Normal Limits setting. The Integrator output sawtooth should appear at GLED and the smoke detection level at RLED. Clock FEED to increase the smoke detection level as needed. Once the desired smoke threshold is reached, the IO input is pulsed low to high to enter the result. See typical waveforms in Figure 4-4. Operating the circuit in this manner, with nearly continuous IRED current for an extended period of time, may result in undesired or excessive heating of the part. The duration of this step should be minimized.
- 4. Apply a second clock pulse to the TEST input to enter in T2 mode. This initiates the calibration mode for Hysteresis Limits. Clock FEED as in Step 3 and apply pulse to IO, once the desired level is reached. Operating the circuit in this manner, with nearly continuous IRED current for an extended period of time, may result in undesired or excessive heating of the part. The duration of this step should be minimized.

- 5. Apply a clock pulse to the TEST input again to enter in T3 mode and initiate calibration for Hush Limits. Clock FEED as in the previous steps and apply a pulse to IO once the desired level is reached. Operating the circuit in this manner, with nearly continuous IRED current for an extended period of time, may result in undesired or excessive heating of the part. The duration of this step should be minimized.
- 6. Apply a clock pulse to the TEST input a fourth time to enter in T4 mode and initiate the calibration for Chamber Test Limits. Clock FEED and apply pulse to IO once desired level is reached. Operating the circuit in this manner, with nearly continuous IRED current for an extended period of time, may result in undesired or excessive heating of the part. The duration of this step should be minimized.
- 7. Apply a clock pulse to the TEST input a fifth time to enter in T5 mode. After limits have been set, pulse IO to store all results in memory. Before this step, no limits are stored in memory. With LTD disabled, the LTD baseline measurement does not have to be made before pulsing IO high to store test limits in memory.

I.

#### 4.4 Serial Read/Write

As an alternative to the steps in **Section 4.3 "Smoke Calibration**", if the system has been wellcharacterized, the limits and baseline can be entered directly from a serial read/write calibration mode.

To enter this mode, follow these steps:

- 1. Set up the application as shown in Figure 4-1.
- 2. Drive TEST2 input from  $V_{SS}$  to  $V_{DD}$  to enter in Programming mode. TEST2 should remain at  $V_{DD}$  until all data has been entered.
- Clock the TEST input to mode T6 (High = V<sub>BST</sub>, Low = V<sub>SS</sub>, 6 clocks). This enables the serial read/write mode.
- 4. TEST now acts as a data input (High =  $V_{DD}$ , Low =  $V_{SS}$ ). FEED acts as the clock input (High =  $V_{BST}$ , Low =  $V_{SS}$ ). Clock in the limits, LTD baseline, functional and parametric options. The data sequence should be as follows:
- 5 bit LTD sample (LSB first)
- 5 bit Chamber Test Limits (LSB first)
- 5 bit Hush Limits (LSB first)
- 5 bit Hysteresis Limits (LSB first),
- 5 bit Normal Limits (LSB first)

- The data sequence follows the pattern described in Register 4-1:
  - 2 bit Photo Amp Gain Factor
  - 2 bit Integration Time
  - 2 bit IRED current
  - 3 bit Low Battery Trip Point
  - 1 bit Long-Term Drift Enable (set to 0)
  - 1 bit Hush Option
  - 1 bit Low Battery Hush Enable
  - 1 bit EOL enable
  - 1 bit Tone Select

A serial data output is available at HB.

5. After all 39 bits have been entered, pulse IO to store into the EEPROM memory.

#### 4.5 Limits Verification

L

After all limits have been entered and stored into the memory, additional test modes are available to verify if the limits are functioning as expected. Table 4-4 describes several verification tests.

#### TABLE 4-4: LIMITS VERIFICATION DESCRIPTION

| Limit               | Test Description   |
|---------------------|--|
| Normal Limits       | Clock TEST to Mode T7 (7 clocks). With appropriate smoke level in chamber, pull FEED to $V_{DD}$ and hold for at least 1 ms. The HB output will indicate the detection status (High = smoke detected). |
| Hysteresis Limits   | Clock TEST to Mode T8 (8 clocks). Pulse FEED and monitor HB as in Normal Limits case.  |
| Hush Limits         | Clock TEST to Mode T9 (9 clocks). Pulse FEED and monitor HB.   |
| Chamber Test Limits | Clock TEST to Mode T10 (10 clocks). Pulse FEED and monitor HB.   |

L

#### 4.6 Horn Test

The last test mode allows the horn to be enabled indefinitely for audibility testing. To enter this mode, clock TEST to Mode T11 (11 clocks). The IO pin is configured as horn enable.

#### 5.0 APPLICATION NOTES

#### 5.1 Standby Current Calculation and Battery Life

The supply current shown in the DC Electrical Characteristics table is only one component of the average standby current and, in most cases, can be a small fraction of the total, because power consumption generally occurs in relatively infrequent bursts and depends on many external factors. These include the values selected for IRED current and integration time, the V<sub>BST</sub> and IR capacitor sizes and leakages, the V<sub>BAT</sub> level, and the magnitude of any external resistances that will adversely affect the boost converter efficiency.

A calculation of the standby current for the battery life is shown in Table 5-1, based on the following parameters:

| V <sub>BAT</sub>     | = | 3         |
|----------------------|---|-----------|
| V <sub>BST1</sub>    | = | 3.6       |
| V <sub>BST2</sub>    | = | 9         |
| Boost capacitor size | = | 4.70E-06  |
| Boost Efficiency     | = | 8.50E-01  |
| IRED on time         | = | 2.000E-04 |
| IRED Current         | = | 1.000E-01 |

#### TABLE 5-1:STANDBY CURRENT CALCULATION

The following paragraphs explain the components in Table 5-1 and the calculations in the example.

#### 5.1.1 FIXED I<sub>DD</sub>

L

L

The  $I_{DD}$  is the Supply Current shown in the DC Electrical Characteristics table.

#### 5.1.2 PHOTO DETECTION CURRENT

Photo Detection Current is the current draw due to the smoke test every 10.75 seconds and the chamber test every 43 seconds. The current for both the IR diode and the internal measurement circuitry comes primarily from  $V_{BST}$ , so the average current must be scaled for both on-time and boost voltage.

The contribution to  $I_{BAT}$  is determined by first calculating the energy consumed by each component, given its duration. An average power is then calculated based on the period of the event and the boost converter efficiency (assumed to be 85% in this case). An  $I_{BAT}$  contribution is then calculated based on this average power and the given  $V_{BAT}$ . For example, the IR drive contribution during chamber test is detailed in Equation 5-1:

#### **EQUATION 5-1:**

$$\frac{3.6V \times 0.1A \times 200\,\mu s}{43s \times 0.85 \times 3V} = 0.657\,\mu A$$

#### 5.1.3 LOW BATTERY CHECK CURRENT

The Low Battery Check Current is the current required for the low battery test. It includes both the loaded (RLED on) and unloaded (RLED off) tests. The boost component of the loaded test represents the cost of charging the boost capacitor to the higher voltage level. This has a fixed cost for every loaded check, because the capacitor is gradually discharged during subsequent operations and the energy is generally not recovered. The other calculations are similar to those shown in Equation 5-1. The unloaded test has a minimal contribution because it involves only some internal reference and comparator circuitry.

#### 5.1.4 BATTERY LIFE

When estimating the battery life, several additional factors must be considered. These include battery resistance, battery self discharge rate, capacitor leakages and the effect of the operating temperature on all of these characteristics. Some number of false alarms and user tests should also be included in any calculation.

For 10-year applications, a 3V spiral wound lithium manganese dioxide battery with a laser seal is recommended. These can be found with capacities of 1400 to 1600 mAh.

#### 5.1.5 FUNCTIONAL TIMING DIAGRAMS

**FIGURE 5-1:** RE46C190 Timing Diagram – Standby, No Alarm, Low Supply Test Failure and Chamber Test Failure.

#### APPENDIX A: REVISION HISTORY

#### Revision C (July 2018)

The following is the list of modifications:

- Updated the AC Electrical Characteristics table.
- Updated Table 4-2.

L

- Added Note 5 in Table 4-3.
- Updated Register 4-1.
- Updated Section 4.3 "Smoke Calibration".
- Updated Section 4.4 "Serial Read/Write".

#### **Revision B (December 2016)**

The following is the list of modifications:

- Updated Section 3.0 "Device Description".
- Updated Section 6.1 "Package Marking Information".
- Minor typographical corrections.

#### **Revision A (December 2010)**

• Original Release of this Document.

NOTES:

#### **PRODUCT IDENTIFICATION SYSTEM**

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

#### Note the following details of the code protection feature on Microchip devices:

- · Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEEL00® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
